

New, red colour of Aspen 2, alkylate petrol

In late summer/autumn 2024, the Aspen 2 will receive a major update with a new distinctive red colour to improve visibility and distinction. The purpose is to create a unified global identity and make it easier for our customers worldwide to choose the right product.

The colour change does not affect the quality and properties of the fuel

Although no impact was expected, engine tests have been carried out to ensure that the change of dye in the petrol does not affect engine purity or performance, and that the red petrol is fully miscible with other fuel blends using different oils. We are convinced that this change will make it easier and safer for our customers to choose the "new" Aspen 2 for their machines and equipment.

A new SDS will be available.

Summary

- The red colour improves visibility and distinction
- Unified global identity
- Tested and verified - the red colour does not affect engine cleanliness or performance
- The petrol with red colour pigment can be mixed with other oil-mixed 2-stroke fuels
- The change is expected to make it easier and safer to choose Aspen 2 for machinery and equipment
